

Quantum Entanglement

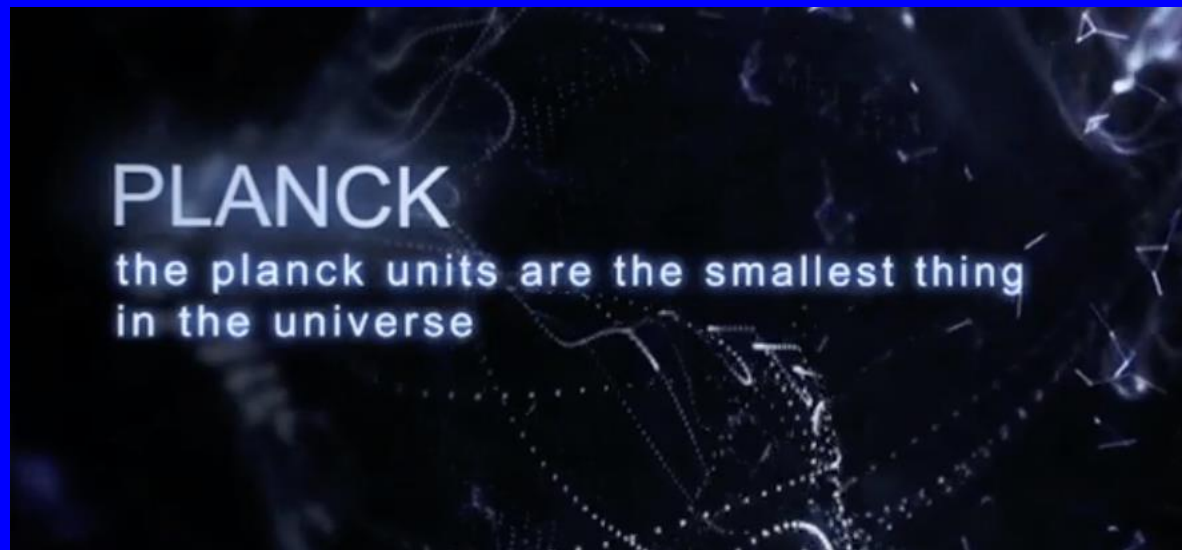

A vibrant, abstract image of a cosmic nebula. The background is a deep, rich purple, with intricate, swirling patterns of lighter purple and white, suggesting gas and dust in space. A bright, yellowish-white light source is visible in the upper left quadrant, casting a glow across the scene. The overall texture is ethereal and dynamic, with various shades of purple, blue, and orange creating a sense of depth and movement.

The larger picture

DOUBLE SLIT EXPERIMENT

Sub-atomic Particles

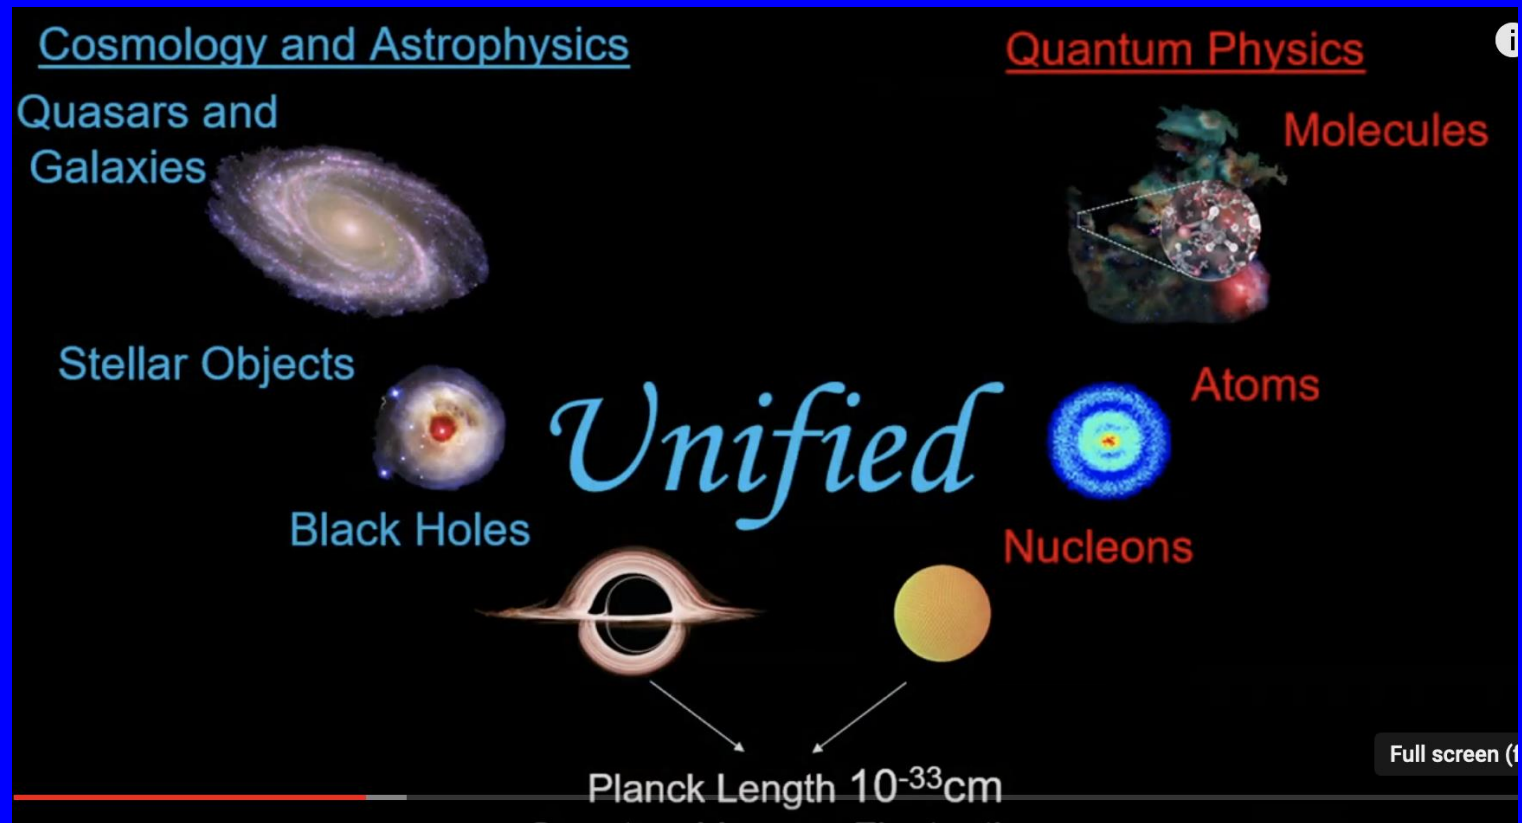

Trillions of planck units cluster together to create sub-atomic particles like photons (**Light**).

Trillions of planck units cluster together to create sub-atomic particles like photons (**Light**).

These sub-atomic particles create atoms that are the basis for all in the physical universe

Building blocks of the universe

- * Something glues the planck particles together into the nucleus of an atom.

- * Something glues the planck particles together into the nucleus of an atom.
- * This same “glue” is used to create molecules, larger physical structures, planets, and galaxies.

- * Something glues the planck particles together into the nucleus of an atom.
- * This same “glue” is used to create molecules, larger physical structures, planets, and galaxies.
- * This “glue” is called **Love**

- * Something glues the planck particles together into the nucleus of atoms.
- * This same “glue” is used to create molecules, physical structures, stars, planets, and galaxies.
- * This “glue” is called **Love**
- * Provides a vast new dimension to the word **Love**

Has given new meaning to
the words

Love and **Light**

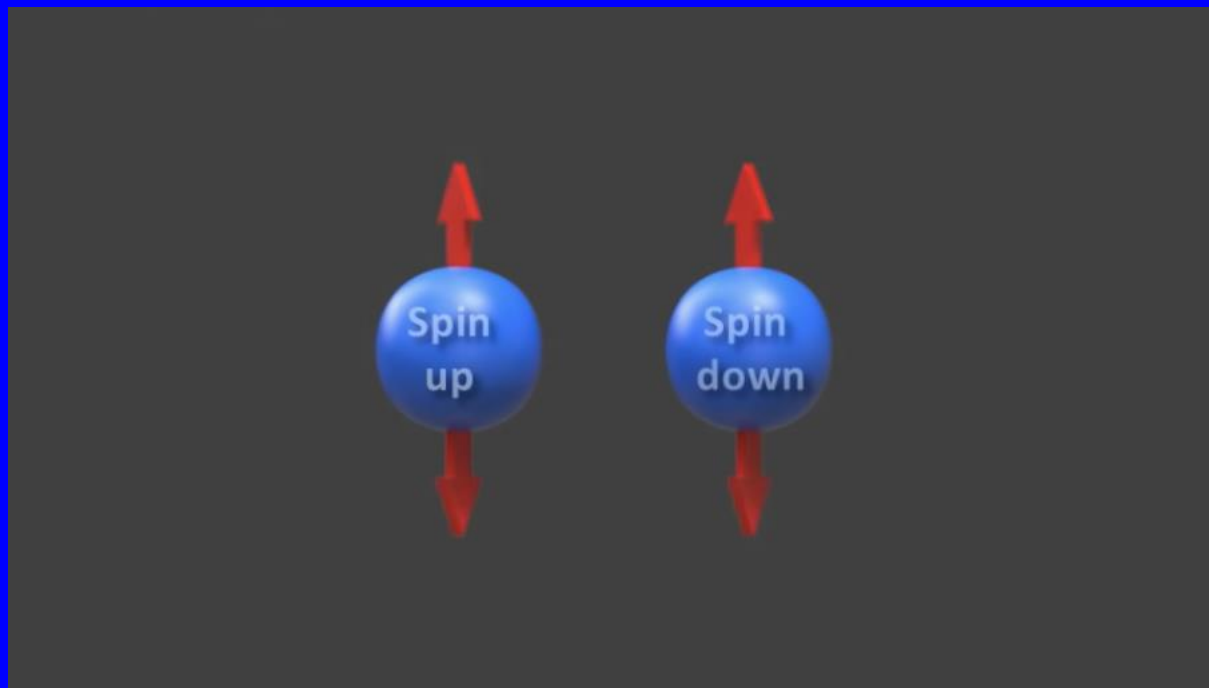

It has completely changed
my understanding of the
universe

Quantum Entanglement

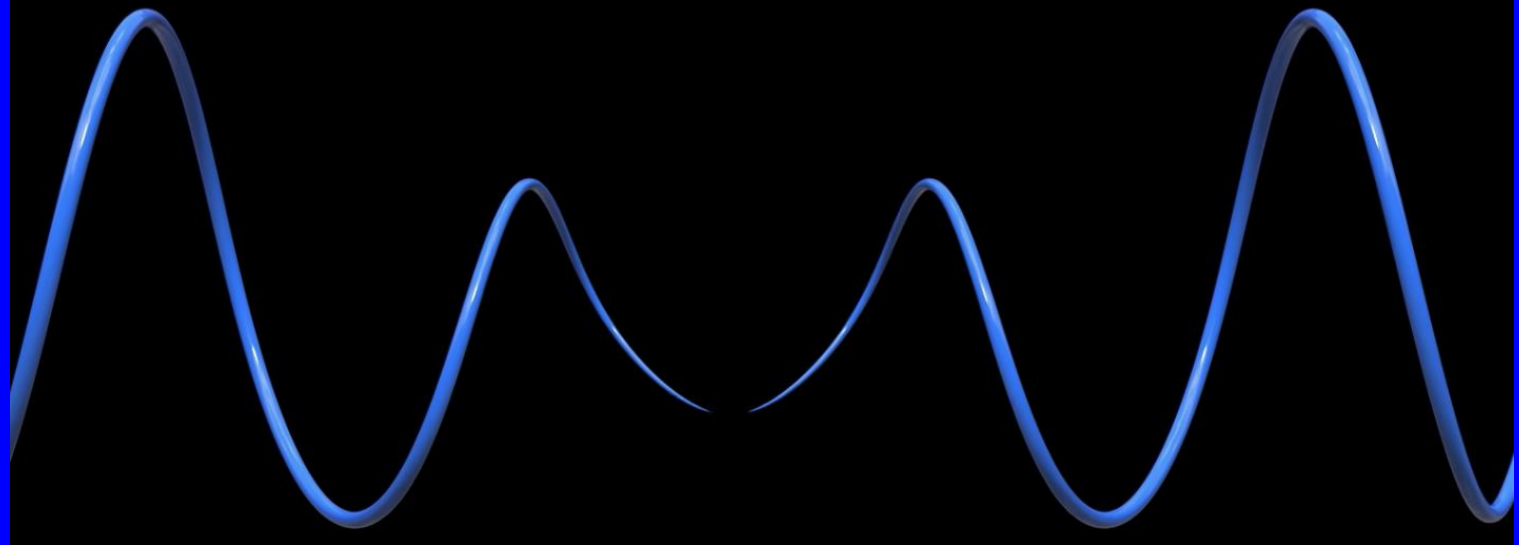

- * Quantum entanglement is what happens when two quantum particles interact.
- * They become interdependent

- * Entanglement is what happens when any two quantum particles interact.
- * They become interdependent
- * Once two particles become entangled it's as if they become a single object – a singular quantum entity = quantum nonlocality

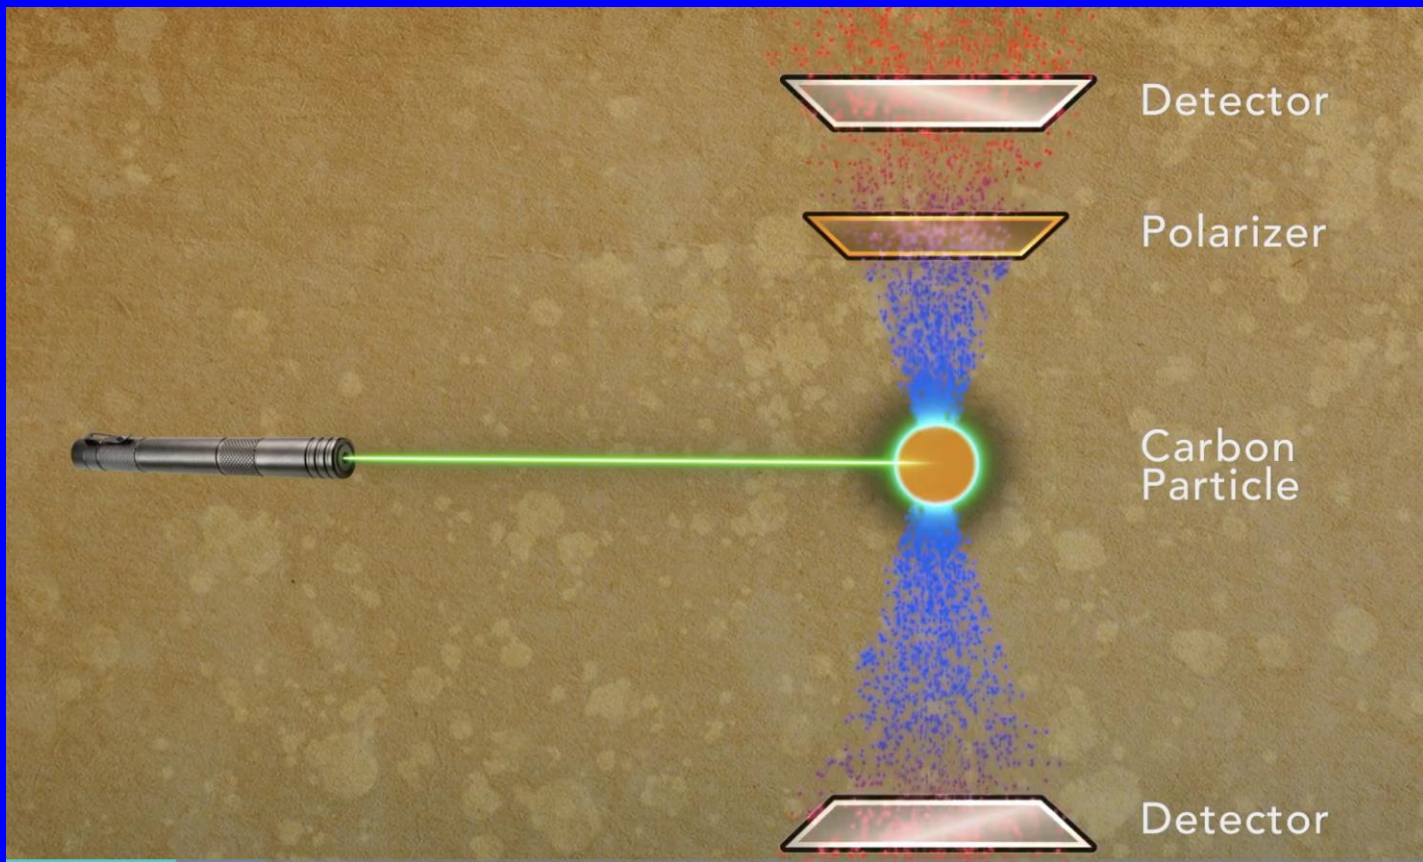

- * Everything in the universe organizes itself around tiny black holes -- from galaxy size to sub-atomic
- * This results in a holographic solution where every point contains the whole

Two entangled particles

- * Whether entangled particles are separated by micro-inches or lightyears, changing one particle makes a change in the other.
- * This doesn't violate the classical speed of light rule because there's no 'movement' through space.

- * Nothing is independent from anything else in the universe
- * Everything is connected through quantum networks of entanglement
- * Anything I do influences everything else in the universe – every action produces a reaction

The universe is entangled
via planck units and the
glue of **Love**

True at the quantum level as
well as all larger physical levels

Quantum entanglement:
we are connected in
many, many, many ways,
and to many, many other
beings and things in a
universe of **Light** and **Love**.

At the planetary level, the
atomic level, and/or the
quantum level, I am **entangled**
with almost everyone and
everything in the universe

I now have a whole new
way of seeing the universe
in terms of **Light**, **Love** and
Entanglement.

I now have a whole new
way of seeing the universe
in terms of **Light**, **Love** and
Entanglement.

I am most grateful for this.
